The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coll; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a eukaryotic cell or by prokaryotic RNA polymerases (ii) first, second, third and fourth recombination sites; (iii) 3 transcription terminating and fourth recombination sites; (iii) 3 transcription terminating and fourth recombination sites, or the second and third recombination sites are identical. The first and second recombination sites, are identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombination sites, or the third and court recombination sites. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing a target nucleic of double-stranded RNA which can be used for silencing a farget mucleic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          7;

                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coll; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter cell or by prokaryotic RNA polymerases of a eukaryotic cell or by prokaryotic RNA polymerases; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and fourth recombination functional in the eukaryotic cell. The first and courth recombination sites, or the second and third recombination sites are identical. The first and second recombination sites, or the second and third recombination sites. The vector is useful for producing large amounts of double-stranded RNA which can be used to convert a DNA fragment into an inverted repeat structure. Plants transformed with a vector from the present invention can be used to convert a DNA fragment into an invention can be used in a conventional breeding scheme to produce more plants with the same characteristics or to introduce a chimeric gene for reduction of the phenotypic expression of nucleic acids. The present sequence represents an acceptor vector nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13180 IGTAGTICGACCGACAGCCTTCCAAATGTTCTTCGGGTGATGCTGCCAACTTAGTCGACG 13239

The present invention describes a vector (1) comprising operably linked CC DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coll; (b) selectable marker region capable of being expressed in the recipient cell coll capable of being recognized by RNA polymerases of a enkaryotic cell or by prokaryotic RNA polymerases; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and fourth recombination functional in the eukaryotic cell. The first and coll polyademylation region functional in the eukaryotic cell. The first and coll properties of the combination sites are identical. The first and second recombination sites, or the second and third recombination sites, or the second recombination sites, or the third and coll courth recombination sites, do not recombination sites, or the third and coll coll coll coll capable of the vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target mucles of double-stranded RNA which can be used for silencing target mucles caping the present invention can be used in a conventional breading scheme to the present invention can be used in a conventional breading scheme to chimeric gene for reduction of the phenotypic expression of nucleic collection from the present sequence represents an acceptor vector nucleotide called and a collection for nucleotide capables.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13480 rerggartireageereraractraecaraacgrearaagirrergraarrereerera 13539
                            New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target nucleic acids and for producing large amounts of doublestranded RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13120 ACTGTAAAACACATATCCAGTCACTATGAATCAACTACTTAGATGATTAGTGACC

cc fourth recombination sites, or the second and third recombination sites are capable of reacting with a same recombination site, and preferably creed identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombine with each other or with a same recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target nucleic closed sequences. The vectors can also be used to convert a DNA fragment into an inverted repeat structure. Plants transformed with a vector from the present invention can be used in a conventional breeding scheme to produce more plants with the same characteristics or to introduce a chimmeric gene for reduction of the phenotypic expression of nucleic capacity. The present sequence represents an acceptor vector nucleotide sequence from the present invention

WPI; 2002-682669/73.

New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target nucleic acids and for producing large amounts of doublestranded RNA.

Claim 17; Page 93~102; 104pp; English.

The present invention describes a vector (I) comprising operably linked by fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coli, (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a eukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polygadenylation region functional in the eukaryotic cell. The first and

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
